Numbers

Number types are divided into two groups: integer types and floating point types.

Integer (i32)

The i32 type is used to store whole numbers, positive or negative (such as 123 or -456), without decimals:

```
fn main() {
  let age: i32 = 25;
  println!("Age is: {}", age);
}
```

```
Age is: 25
```

Floating Point (f64)

The f64 type is used to store numbers containing one or more decimals:

```
fn main() {
  let price: f64 = 19.99;
  println!("Price is: ${}", price);
}
```

```
Price is: $19.99
```

CHAR-

```
fn main() {
  let myGrade: char = 'B';
  println!("{}", myGrade);
}
```

```
B
```

Strings (&str)

```
fn main() {
  let name: &str = "John";
  println!("Hello, {}!", name);
}
```

```
Hello, John!
```

Booleans (bool)

```rust
fn main() {
  let is_logged_in: bool = true;
  println!("User logged in? {}",
is_logged_in);
}
```

```
User logged in? true
```

```rust
fn main() {
  let name = "John";
  let age = 28;
  let is_admin = false;

  println!("Name: {}", name);
  println!("Age: {}", age);
  println!("Admin: {}", is_admin);
}
```

```
Name: John
Age: 28
Admin: false
```
